

Pipeline Status Cleanup

Standard Operating Procedure · REI BlackBook Property Pipeline

Twin Home Buyer / Equity Track · Version 1.0 · 2026-07-15

1 What this automation does

The Pipeline Status Cleanup app goes through the **"New" bucket** of the REI BlackBook Property Pipeline and sets each lead's correct status based on the rep's own work — so the pipeline reflects reality instead of everything sitting on "New."

- Reads each lead's **attached contact** (the rep's Lead Stage / Call Disposition) — it follows the rep's categorization, it does not guess.
- Sets each lead to one of four pipeline stages — **New**, **Evaluating**, **Under Contract**, or **Closed** — fully automatically (no human step).
- **Closed** is used for both dead/lost and sold leads, and the bot writes a **note explaining why** it was closed.
- **Flags** conflicting or unclear leads and **duplicates** with an explanatory note.
- Cleans obvious **address** formatting (Street / City / ZIP). The **State field is never touched**.
- Everything it does is **reversible** and **reload-verified** (it confirms each change actually saved).

2 How it works — the process

Each run works the whole New bucket top-to-bottom, one lead at a time:

- 1 Open the REI pipeline and load every New lead.
- 2 For each lead, open its **attached contact** and read the latest Lead Stage / disposition and activity.
- 3 Decide the correct status from that signal (see the rules in section 3).
- 4 Write the status, then **reload and verify** it stuck (retry if not).
- 5 Write an explanatory **note** — why a lead was Closed (dead/sold) or put Under Contract, and for flagged / duplicate leads (skips if the same note already exists).
- 6 Tidy the address formatting where safe; leave the State field alone.
- 7 Save progress (checkpoint) and move to the next lead.

Safe & resumable. If the connection drops or the app is closed, it picks up where it left off — no lead is lost or double-processed.

3 The four pipeline stages

Every lead is set to one of four stages, taken from the rep's own Lead Stage — fully automatic, no human step:

STAGE	WHEN THE ATTACHED CONTACT SHOWS...	WHAT THE BOT DOES
-------	------------------------------------	-------------------

New (leave)	No notes and no contact — nobody has touched the lead	Left as-is
Evaluating	Any contact made / analysis started — called, texted, emailed, offer being worked, comps run	Set Market Status → Follow up
Under Contract	A signed contract / accepted offer is noted	Set Market Status → Under Contract
Closed	Deal closed or dead — per the note	Set Market Status → Closed + a note saying why (dead / lost / sold)

Also handled automatically: Duplicates (same address) are flagged with a note — never merged or deleted. **Conflicting or unclear** leads (e.g. a dead stage plus a later re-inquiry, or outreach logged with no Lead Stage) are left unchanged and flagged with an explanatory note for a person to look at.

Closed = dead OR sold. Both land in the Closed stage; the automation writes a note on each one stating the reason, so you can tell a dead lead from a sold property at a glance.

4 Daily operating procedure

- 1 Open the **Pipeline Status Cleanup** app (Desktop or Start Menu icon).
- 2 If it's the first run of the day, make sure you're **logged into REI** in the Chrome window it opens.
- 3 (Optional) Run once in **Audit** mode to preview — nothing is written.
- 4 Switch **Mode** → **Live** and click **Start**.
- 5 Let it run the full bucket. Watch the **clock** and the stat cards.
- 6 When it finishes, open **Report** → **Save as PDF** for the daily summary.
- 7 Spot-check a few leads in REI (a Follow up, a Dead) and confirm the State field is unchanged.

It runs the whole backlog each day and re-runs the next day for the new shift's leads.

5 How to use — on the local PC

- 1 Double-click the **Pipeline Status Cleanup** icon (house + green check).
- 2 The app opens in its own window (toolbar, stat cards, run clock).
- 3 Pick **Audit** (read-only) or **Live** (writes), then **Start**.
- 4 Keep the window open while it runs; close it (or Stop) to end.

Team view on office Wi-Fi. While it's running, the app shows a "Share on this Wi-Fi" link with a **Copy** button. Teammates on the same network open that URL in a browser to watch progress and the daily report — no install needed.

6 How to use — remotely via AnyDesk

The automation must run on the office PC that stays logged into REI. Use AnyDesk to reach that PC from anywhere.

- 1 On the office PC: keep it **powered on, signed in, and AnyDesk running**. Note its **AnyDesk ID** (9-digit number).
- 2 On your PC: open AnyDesk, type the office PC's **AnyDesk ID** in "Remote Desk", click **Connect**.
- 3 Enter the access password (or accept the prompt on the office side).
- 4 You now see the office desktop. Double-click the **Pipeline Status Cleanup** app and run it as in section 5.
- 5 When done you can **disconnect** AnyDesk — the app keeps running on the office PC.

Important: AnyDesk is a remote view of the office PC — the automation and the REI login always run **on that office PC**, not on your local machine. Don't shut the office PC down while a run is in progress.

7 Dashboard & daily report

- **Stat cards** — Reviewed, Follow up, Dead, Under Contract, Flagged, Duplicates. Click any card to see those leads with links into REI.

- **Run clock** — shows how long the automation has been running.
- **Daily Report** — a clean one-page summary (plain-English + the key numbers) that you Save as PDF for records/management.

8 Limitations & safety

- **State field is never changed — "CA" cannot be set in the app.** REI's State dropdown only stores full names ("California"); there is no "CA" option, so the browser automation cannot produce the "CA" abbreviation. Storing literal "CA" (and filling blank states) requires the **REI BlackBook API** — a separate one-time pass, outside this app. Until then, the State field is left exactly as-is.
- **Addresses on leads with a contact** can't be re-formatted in the UI (REI reverts them) — these are flagged for a later CSV/API pass. Leads without a contact are cleaned normally.
- **Duplicates are flagged, never merged or deleted** — a person makes the final merge decision.
- **Closed covers dead and sold** — both use the "Closed" status; the reason (dead / lost / sold) is written in a note on each lead.
- Everything is **reversible** and every write is **reload-verified** (each change is confirmed after a reload; it retries if it didn't stick).

9 Troubleshooting

SYMPTOM	FIX
App window doesn't open	Re-run the installer, or from the folder run <code>npm run electron</code>
Asks to log in every time	Log into REI once in the Chrome window it opens; the session is then saved
Run stopped partway (dropped connection)	Reopen the app and Start again — it resumes from the last checkpoint
Teammates can't open the Wi-Fi link	Allow Node/Electron through Windows Firewall on the office PC (Private network)

10 App files & setup reference

- **Source / code repository:** github.com/rosanes-cmyk/Pipe-Automation (branch: `claude/pipeline-status-cleanup-test-61hwcr`)
- **Setup on a new PC:** see `SETUP_NEW_PC.md` and `INSTALL_APP.md` in the project folder.
- **Download the app (installer for teammates):**
drive.google.com/file/d/10Zdv6k7x8gaHUsaqQOb7yCycvGwcCOt5/view
 Pipeline Status Cleanup Setup 0.1.0.exe — download, double-click, install.

This is the file to give teammates. The Setup .exe above bundles everything (app + Electron + ffmpeg.dll + dependencies). Download it, run it, and it installs like a normal program with a Desktop / Start-Menu shortcut. (Do **not** share a bare `electron.exe` — that fails with the *ffmpeg.dll not found* error.)

11 Rebuild the app & share it online with teammates

This produces a single **Setup installer** that bundles everything (app + Electron + ffmpeg.dll + dependencies). Teammates download that one file, run it, and the app installs like any normal program.

Build the installer (on a Windows PC with Node.js)

- 1 Open PowerShell in the project folder:
`cd C:\Users\<you>\Documents\Pipe-Automation\rei-pipeline-cleanup`
- 2 Get the latest code:
`git pull origin claudes/pipeline-status-cleanup-test-6lhwc`
- 3 Run the one-command builder:
`powershell -ExecutionPolicy Bypass -File .\Build-Installer.ps1`
(or manually: `npm install` then `npm run dist`)
- 4 When it finishes, the installer is in the **dist** folder:
`dist\Pipeline Status Cleanup Setup 0.1.0.exe`

Share it online

- 1 Upload that **Setup .exe** to Google Drive (or your shared drive).
- 2 Right-click the file → **Share** → set "Anyone with the link" → **Copy link**.
- 3 Send teammates the link. They download it, double-click, and install.
- 4 On first launch each person logs into REI once in the Chrome window it opens.

Current download link: drive.google.com/file/d/10Zdv6k7x8gaHUsaqQOb7yCycvGwcCOt5/view — *Pipeline Status Cleanup Setup 0.1.0.exe*. Replace this link after each rebuild with the new version's link.

Rebuild whenever the app changes. The Setup .exe is a snapshot. After any code update, `git pull` and run the builder again, then re-upload the new Setup .exe (delete the old one so no one installs a stale version).

Note: the installer must be built on **Windows**, and the build needs internet the first time (it downloads packaging tools). Each teammate still does the one-time REI login on their own machine — the app automates *your* logged-in REI session per PC; it cannot log in for them.
